Executive Summary

An annual comprehensive safety audit conducted by the Oil Industry Safety Directorates (OISDs) revealed several critical issues affecting the operational integrity of Equipment No. **E-2. These include inadequate insulation layers, insufficient protective coatings, and outdated control systems. Immediate corrective measures were identified to mitigate potential hazards and ensure compliance with current industry regulations. ---

Documented Specifications &

Parameters

Parameter	Value
Equipment Name	E-2
Location	Main Processing Unit
Manufacturer	XYZ Corp.
Model	Type X
Serial Number	123456

Inspected Components & Details

- **Inspection Date:** March 15, not specified in the available documentation
- **Inspector:** John Doe, Senior Engineer
- **Scope of Work:** Comprehensive inspection including surface assessment, structural evaluation, and functional testing.

Surface Assessment

- **Condition Rating:** Poor
- **Reasoning:** Exposed metal surfaces show signs of corrosion, indicating poor insulation and lack of proper protection against environmental factors.

Structural Evaluation

- **Component Identified:** Tank A
- **Issue Found:** Corrosion detected along the tank walls, compromising its structural integrity.
- **Recommendation:** Reapply epoxy coating over corroded areas to enhance durability and prevent further degradation.

Functional Testing Results

####

- **Test Conducted:** Pressure Test on Tank A
- **Result:** Failed due to severe leakage around the corroded area.
- **Conclusion:** Critical defect requiring immediate repair before resuming operations.
